

## WRITTEN PLAN FOR “MY FAVORITE ACTIVITIES”

- Create Index.html, add buttons, a section for holding all the information and other sections.
- Create main.css file.
- Create the sass modules, and call all the sass components to main.scss.
- Make sure to link the css and scss files.
- Now create the JSON objects; 5 favourite things of mine, Include images, desc, name, and a tagline.
- Now convert all the json objects to regular objects using API. Use function getData.
- And create an error handling object.
- Later link the buttons with these objects, such that each button points to each json object.
- When the buttons are working, and all the information are displayed properly, add the designs and colours using scss.
- Later, rename the page to main\_page, and create a new index page, as a landing page.
- Add button for navigating to the main\_page.
- Add a close button, for ease of use.
- Do all the final changes.

- Make sure to create appropriate branches throughout the way.
- Finally push every branch to the main branch in github.
